

```
using Plots
gr()
default(fmt = :png)
```

[2]: `using DataFrames`

Using Plots.jl

Plots.jl outputs plots in different formats. It is written in Julia:

```
f(x) = sin(x)
g(x) = cos(x)
h(x) = tan(x)
```

[21]:

```
h (generic function with 1 method)
```

[22]: `xs = LinRange(0, 2pi, 100)`

```
100-element LinRange{Float64, Int64}:
 0.0, 0.0634665, 0.126933, 0.1904, ..., 6.09279, 6.15625, 6.21972, 6.28319
```

These are the trigonometric functions, $\sin(x)$ $\cos(x)$ $\tan(x)$ According to Wikipedia, their graphs look like this:

```
plot(xs, [f, g, h]; ylim = (-2, 2), framestyle = :box, grid = false, palette
= :tab10)
```

[23]:

Let's produce an error:

[24]: `i(x)`

```
UndefVarError: `i` not defined
```

```
Stacktrace:
```

```
[1] top-level scope
      @ In[24]:1
```

Rich Outputs

We can try some table outputs, for example:

[3]: `df = DataFrame(col1 = ["First", "Second", "Third"], col2 = [1, 2, 3])`

```
3×2 DataFrame
 Row | col1   col2
     | String Int64
-----|-----
  1 | First      1
  2 | Second     2
  3 | Third      3
```
