

```
using Plots
gr()
default(fmt = :png)
```

```
[2]: using DataFrames
```

Using Plots.jl

Plots.jl outputs plots in different formats. It is written in Julia:

```
[21]: f(x) = sin(x)  
      g(x) = cos(x)  
      h(x) = tan(x)
```

```
h (generic function with 1 method)
```

```
[22]: xs = LinRange(0, 2pi, 100)
```

```
100-element LinRange{Float64, Int64}:  
 0.0, 0.0634665, 0.126933, 0.1904, ..., 6.09279, 6.15625, 6.21972, 6.28319
```

These are the trigonometric functions, $\sin(x)$ $\cos(x)$ $\tan(x)$ According to Wikipedia, their graphs look like this:

```
[23]: plot(xs, [f, g, h]; ylim = (-2, 2), framestyle = :box, grid = false, palette
      = :tab10)
```

Let's produce an error:

```
[24]: i(x)
```

```
UndefVarError: `i` not definedStacktrace: [1] top-level scope @ In[24]:1
```

Rich Outputs

We can try some table outputs, for example:

```
[3]: df = DataFrame((col1 = ["First", "Second", "Third"], col2 = [1, 2, 3]))
```

```
3x2 DataFrame
Row  col1  col2
     String Int64
1    First     1
2   Second     2
3    Third     3
```
